It took me 2 days to find the exact issue and solution for this problem. I advise @Maximilian to share this solution in as a video update.

## Follow the steps if you are facing issues with

- 1. Follow steps in current lecture named **"Using a Load Balancer for a Stable Domain"**
- 2. Mongo db image doesn't allow authentication as the tutorial is based on an older image on Docker hub so instead using image **"mongo"** use **"mongo:3.6.19-xenial"**

Container name\*

mongodb

i

Image\*

mongo:3.6.19-xenial

i

3. goals-backend container expects that the mongoDB server is already started. For this **edit goals-backend container** and add **"Startup Dependency Ordering"** as follows
- container name: "mongodb"**
- condition: "start"**

STARTUP DEPENDENCY ORDERING

Control the order in which the containers in your task definition start. [View Documentation](#)

Container name	Condition	
mongodb	START	x
<div>+ Add container dependency</div>
